```

```
gam print printjobs [older_than <number><m|h|d>]
[newer_than <number><m|h|d>] [query <query>]
[status <status>] [printer <printer id>] [owner <user
email>] [limit <number>] [orderby create_time |
status | title] [ascending | descending] [todrive]
```

Customer

```
gam info customer
```

```
gam update customer [alternateemail <EmailAddress>]
[language <LanguageCode>] [phone <String>]
[organizationname <String>] [contactname <String>]
[countrycode <String>] [addressline1 <String>]
[addressline2 <String>] [addressline3 <String>]
[locality <String>] [region <String>] [postalcode
<String>] [countrycode <String>]
```

Definitions

<who> user <user email> | group <group email> | ou <ouname> | all users
<datetime> RFC3339 formatted date and time, e.g. YYYY-MM-DDThh:mm:ss.000Z

<user email> is a user in the domain
<group email> is a group in the domain
<email address> is any email address

Bulk Operations

```
gam csv | csvprint <csv-filename> gam <regular
command>
```

Arguments starting with ~ will be substituted with the value from the CSV row. For example:

```
gam csv newusers.csv gam create user ~Email firstname
~Firstname lastname ~Lastname password
~Password gal off changepassword off org
Testing/Students
```

Note that the ~ (tilde) character may need to be escaped in some environments.

Locally filter CSV output using the environment variables GAM_CSV_HEADER_FILTER (comma-separated list of column headers) and GAM_CSV_ROW_FILTER (JSON string containing column to filter on and value we want).

GAM_CSV_HEADER_DROP_FILTER removes listed headers from results.

Run multiple gam commands from batch file:

```
gam batch <batch-filename>
```

When the command "commit-batch" is found, all previous commands will be completed before execution continues.

Parallel Commands

For both csv and batch commands, GAM will run multiple actions in parallel. By default, GAM starts 5 worker threads and can run 5 commands at a time. You can raise or lower this setting by setting an environment variable called GAM_THREADS.

Going much higher than 20 threads is not recommended or you're likely to see issues with Google API quotas.

OAuth Key Management

Set the variable OAUTHFILE in your shell to the file containing the OAuth credentials and the variable OAUTHSERVICEFILE to the file containing the service account JSON key. The file must be in the same folder as gam.exe/gam.py or contain a path relative to this folder.

```
gam oauth info [<access token>]
```

```
gam oauth create [<EmailAddress>]
```

```
gam oauth create [admin <EmailAddress>]
```

```
[scope|scopes <APIScopeURLList>]
```

```
gam oauth revoke
```

```
gam show sakey [all | system | user]
```

```
gam rotate sakey [local_key_size <1024|2048|4096>]
```

```
[retain_none | retain_existing | replace_current]
```

```
[algorithm KEY_ALG_RSA_1024 |
```

```
KEY_ALG_RSA_2048]
```

```
gam delete sakeys <key_ids> [doit]
```

Environment Variables

The following environment variables are supported.

GAMUSERCONFIGDIR
GAMSITECONFIGDIR
GAMCACHEDIR
GAMDRIVEDIR
OAUTHFILE
OAUTHSERVICEFILE
CLIENTSECRETS
GA_DOMAIN
CUSTOMER_ID
GAM_CHARSET
GAM_THREADS
GAM_AUTOBATCH
GAM_BATCH_SIZE
GAM_CSV_HEADER_FILTER
GAM_CSV_HEADER_DROP_FILTER
GAM_CSV_ROW_FILTER
GAM_TLS_MIN_VERSION
GAM_TLS_MAX_VERSION
GAM_CA_FILE
